

Experiment No. 2

Aim : Demonstration of var, let, const, Template Literals, destructuring and Billing Calculator using JavaScript

Software / Tools Required:

1. Visual Studio Code
2. Google Chrome
3. HTML5
4. JavaScript (ES6)

Theory: JavaScript ES6 introduced several modern features that make programming easier and more efficient.

a) var

1. Function-scoped variable.
2. Can be redeclared and updated.

b) let

1. Block-scoped variable.
2. Can be updated but cannot be redeclared in the same scope.

c) const

1. Block-scoped variable.
2. Cannot be reassigned after initialization.

d) Template Literals

Template literals allow embedding variables directly inside strings using backticks (.) and \$ {}.

e) Destructuring

Destructuring extracts values from arrays or objects into separate variables.

Case Study: To create a billing calculator webpage for a shopping app using JavaScript, HTML, and CSS.

Accepts user input such as:

1. Customer Name
2. Phone Number
3. Address
4. Quantity It calculates:

1. GST
 2. Total Price
 3. Grand Total
-

Conclusion: The practical was completed successfully. The concepts of var, let, const, template literals, and destructuring were implemented. A billing calculator was developed that accepts user input, performs calculations, and displays the final bill accurately using JavaScript.
