

Experiment No: 8

Title:

Access and Validate Form Fields Using Events by Designing a Gym Admission Form with Live Input Checks.

Software/Tools Required:

- Visual Studio Code
- Web Browser such as Google Chrome
- HTML, CSS, and JavaScript

Theory:

Forms are an essential part of web applications as they allow users to enter and submit information. JavaScript provides various methods to **access form fields** and validate the entered data before it is processed. Form validation improves data accuracy, enhances user experience, and prevents invalid or incomplete information from being submitted.

JavaScript can access form elements using methods such as `getElementById()`, `getElementsByName()`, `querySelector()`, and the forms collection. Once an element is accessed, its value can be read, modified, or validated dynamically.

Events play an important role in making forms interactive. An event is an action performed by the user or the browser, such as clicking a button, typing in a text field, selecting an option, or moving the cursor away from an input field. JavaScript provides event listeners such as `input`, `change`, `focus`, `blur`, `submit`, `click`, and `keyup` to respond to these actions. These events allow validation to occur instantly as the user enters data, a technique known as **live input validation**.

This experiment demonstrates the practical implementation of event-driven programming and client-side form validation, resulting in an interactive, user-friendly, and reliable web application.

Result/Conclusion:

Thus, JavaScript was successfully used to access form fields and perform live validation using events. A Gym Admission Form was developed that validates user input in real time, displays appropriate error messages, and ensures that only valid information is accepted before form submission.
